

Deposit Dynamics at the Large Regionals Coming Out of the Last Cutting Cycle

Leonid Rempel

- **Takeaway:** This memo infers deposit dynamics in the last cutting cycle (2024Q3 to 2026Q2) at 15 large regional banks (CCARs + 5), using Call Report filings and public earnings calls for context. Each bank is read on (i) the **need for funding** (Table 1a), (ii) the **price and sensitivity of its deposits** (Table 1b, Chart 1b, Table 2), and (iii) the **liquidity available to absorb runoff** (Table 3). Going into a hiking cycle, three combinations to watch:
 1. **Funding need, above-median cost, thin liquidity: FHN, ZION and HBAN.** These firms face all three factors. Loan growth outpaced deposits by 2.2-4.8 points of starting deposits (vs median 1.6), interest-bearing costs run 13-16bps above the median, and cash plus unpledged securities cover 0.05x-0.29x of the runoff pool (median 0.38x). They have the least room to absorb outflows (Tables 1a, 1b, 3).
 2. **Rate-sensitive deposits and high betas: PNFP, EWBC, FCNCA and FHN.** CDs and brokered funding are 20%-50% of interest-bearing deposits (median 19%, up from 10% before the last hiking cycle) and up-cycle betas were 0.49-0.56 (median 0.44). Apart from FHN, these banks paid up to grow deposits and carry the highest costs; deposits kept pace with or outpaced their loans, so they appear more exposed to repricing than to a funding need, though customer-level sensitivity is unobserved (Table 1b, Chart 1b, supporting chart 4).
 3. **Funding need starting from a cheap base: PNC, USB and FITB.** Loans outpaced deposits by 3.4-6.1 points, but interest-bearing costs of 2.03%-2.13% sit 3-12bp below the median. Marginal funding costs more than the base: a median CD is 3.35%, against a median interest-bearing cost of 2.16% (0.10% before the last hikes), so each replacement dollar costs more than the average (Tables 1a, 3).
- **Need for funding (Table 1a).** At firms where loans outpaced deposits (PNC, HBAN, USB, ZION, FITB, TFC and FHN) the gap is financed by wholesale funding, equity, or drawing down securities and cash (Table 1a, Appendix B). Growth alone did not explain the change in cost over the previous cycle (supporting charts 1-2), but we can see some relationship where banks that had loans outrun deposits saw interest-bearing costs rise against peers over the next year, so we treat the gap as a potential indicator of future funding cost.
- **Price and sensitivity of deposits (Tables 1b, 2, Chart 1b).** *Observed:* CDs and brokered funding are 30%-50% of interest-bearing deposits at ZION, FHN, PNFP, WAL and EWBC, and up-cycle betas were above the median at PNFP, EWBC, FCNCA and FHN but not at ZION, WAL and HBAN. Because total deposit cost reflects free noninterest-bearing balances, ZION (34% noninterest-bearing) looks cheaper on that basis (1.49% against a 1.61% median) and USB (16%) more expensive (1.79%) than their interest-bearing costs suggest. Costs compressed in proportion across banks since the first cut, so the cost differences between banks are largely structural (supporting charts 1-3). This suggests that banks with more CDs and brokered funding and historically higher betas appear more exposed to repricing; RF, MTB and FITB show the strongest franchise indicators (costs 9-48bp below the median, noninterest-bearing share 27%-31% against 25%, up-cycle betas 0.29-0.42), which suggests less pass through in a hike.
- **Liquidity to absorb runoff (Table 3).** Relative to peers, FHN and ZION look weakest: both have a funding need and lean on CDs and brokered funding (30%-34% of interest-bearing deposits against a 19% median), with the thinnest cushion of cash and unpledged securities against deposits that could leave. HBAN has the same funding need and a thin cushion from a median CD mix. WAL and PNFP also lean on CDs, brokered funding and FHLB advances (5.7%-5.9% of assets against a 2.6% median) on a thin cushion, but deposits kept pace with their loans. 11 of the 15 managements noted deposit competition intensifying on 2026Q2 calls.
- **M&A screen:** Deposit pressure can be read from both sides of a combination. *Banks that may value deposits most:* FHN, ZION and HBAN have both a funding need and above-median cost, so they gain most from adding cheaper, stable deposits. *Banks with the deposit profile a buyer would value:* RF and MTB combine below-median interest-bearing cost (1.68% and 1.92%), below-median CDs and brokered funding, noninterest-bearing shares of 29%-31%, and loan growth that did not outrun deposits (gaps of -0.6 and 1.6 points). This is a deposit-side screen only.
- **Unique to this hiking cycle:** AI could raise deposit mobility over time if customers automate yield-seeking and banks target rate-sensitive balances faster, amplifying runoff and beta risk at banks with rate-shopper books and thin coverage (Tables 1b, 3). We do not treat this as a base case: account-opening friction and customer inertia limit how fast balances move.
- **Limitations.** This memo does not engage with the asset-side, i.e repricing (securities, fixed-rate loans, swaps). Strategies are inferred from balance sheets and costs, not observed in pricing or customer data. Betas come from the 2021-2024 hikes, when deposits were flush with excess liquidity; this cycle starts from higher costs, so pass-through could differ.

* marks a major merger since 2021 (a large bank or thrift absorbed in the period). Levels are not adjusted for M&A; growth figures are pro forma for deals.

Pricing score (0-100): average percentile rank gathered from interest-bearing cost against the peer median and CDs plus brokered as a share of interest-bearing deposits. Levels are at 2026Q2; changes run from the first cut (2024Q3). Total deposit cost and the betas (both on total deposits), noninterest-bearing and uninsured shares, and wholesale funding growth are context, not scored; the scored cost is on interest-bearing deposits.
Up-cycle = 2021Q4 to 2024Q3; **down-cycle** = 2024Q3 to 2026Q2.

Chart 1a: Who needs to gather and who is already paying more: funding gap against pricing score

Dashed lines = regional sample medians; orange = Fed stress-test firms
 Universal GSIBs (triangles) are scored against the regional sample median

Chart 1b: Who has the deposit franchise: rate-shopper funding against what banks pay

Coverage = (cash + unpledged securities) / (uninsured deposits + brokered deposits + CDs of \$250K or less due within a year): very rough estimate of liquid asset coverage. Definitions are in [Appendix C](#).

Appendix A: supporting charts

Growth did not push funding costs; costs compressed over the last cycle.

- **Growth is not the driver.** From 2024Q3 to 2026Q2, deposit growth (supporting chart 1) and loan growth (supporting chart 2) show no relationship with the change in interest-bearing cost across 25 banks (correlations -0.13 and -0.02).
- **Where a bank started is.** Every bank cut by a similar proportion (about 27%), so each extra point of starting cost went with about 30bp more of a cut (R-squared 0.65; supporting chart 3).
- **So costs compressed, in proportion.** The spread in cost across the banks narrowed from 49bp to 36bp, but relative to the median it did not move (0.16 at the start, 0.16 at the end): banks kept their relative position. Controlling for starting cost, growth adds only about 1.0bp per point (t = 3.2).
- **What this implies.** The cost gap between banks is structural (the CD, brokered and noninterest-bearing make-up in chart 1b) and scales with the level of rates: it widened as rates rose (spread of 7bp at 2021Q4 against 49bp at 2024Q3) and narrowed as they fell. A hike is likely to re-open it, mostly at the banks with the most CDs and brokered funding.

Supporting chart 1: Deposit growth

Change in cost, 2024Q3 to 2026Q2

Supporting chart 2: Loan growth

Change in cost, 2024Q3 to 2026Q2

Supporting chart 3: Starting cost

Change in cost, 2024Q3 to 2026Q2

Blue = focus regionals, orange = GSIBs, green = smaller regionals (25 banks, excluding two with a merger closing at either end of the window). Growth is pro forma for deals; the change in cost is interest-bearing deposit cost in the later quarter less the earlier. Descriptive cross-sections, not causal estimates.

Rate-shoppers roughly doubled during the last hiking cycle.

- **The base has changed.** The median share of CDs plus brokered funding in interest-bearing deposits rose from 10% at 2021Q4 to 19% at 2026Q2, and rose at 14 of the 15 banks (supporting chart 4). The migration happened during the hikes; mix has moved little since the first cut (Table 2).
- **It predicts pass-through.** Banks that began the hikes with more CDs and brokered funding repriced more as rates rose (supporting chart 5). With 15 banks this is a tendency, not a forecast, and the betas come from a period of excess liquidity.

Supporting chart 4: Rate-shopper share

Open = 2021Q4, filled = 2026Q2

Supporting chart 5: Starting share and beta

Beta, 2021Q4 to 2024Q3

Chart 4 is the interest-bearing deposit make-up of the 15 regional banks, pro forma for deals. Chart 5 plots the start-of-hikes share against the up-cycle beta used in Table 1b; the dashed line is the fitted line.

Appendix B: how the funding gap was financed (the accounting)

Assets equal liabilities plus equity, and assets are loans plus securities plus goodwill plus cash and other assets. So the funding gap, the change in loans less the change in deposits, is exactly the sum of the changes in everything else on the balance sheet:

$$\text{Loans } \Delta - \text{Deposits } \Delta = \text{Equity } \Delta - \text{Goodwill } \Delta + \text{Wholesale funding } \Delta - \text{Securities } \Delta - \text{Cash and other } \Delta$$

Each Δ is the actual change on the balance sheet, in percentage points of starting deposits (2024Q3), pro forma for deals and summed over each firm's banks. Assets are subtracted because a book that grew used funding that would otherwise have been available to lend: Western Alliance's cash and other assets rose 7.0 points and its securities 6.3, so the gap is $2.0 - 0.0 + 4.9 - 6.3 - 7.0 = -6.4$: deposits grew faster than loans, and that excess, along with wholesale funding and equity, went into securities and cash. The five terms add up to the gap exactly. These are the columns of Table 1a.

- **Equity** = total assets less total liabilities (RCFD2170 less RCFD2948), which is total equity capital including noncontrolling interests (RCFDG105). It is the balance-sheet equity of the banks, not of the holding company. Its change has four parts that we can separate: **retained earnings** (undivided profits and capital reserves, RCFD3632: net income less dividends paid up to the parent), **AOCI** (RCFDB530, mainly unrealized gains and losses on available-for-sale securities, which improved as rates fell), **paid-in capital** (preferred stock, common stock, surplus and other components, RCFD3838 + 3230 + 3839 + A130: new capital issued or injected by the parent, including stock issued in deals and pushed down to the bank) and **noncontrolling interests**.
- **Goodwill** (RCFD3163) is shown on its own so that acquisition accounting is visible. Stock issued above an acquired bank's book value raises equity (paid-in capital) and goodwill together, with no bearing on how loans were funded. Fifth Third, Pinnacle, Huntington and PNC show the largest goodwill increases.
- **Wholesale funding** = total liabilities less total deposits (RCFD2948 less RCON2200 + RCFN2200): FHLB advances, repo, federal funds purchased, subordinated and other borrowed money, and other liabilities.
- **Securities** = held-to-maturity at amortized cost plus available-for-sale at fair value (RCFD1754 + RCFD1773). Fair-value changes on available-for-sale securities move this and AOCI by the same amount, so marks inflate both sides equally.
- **Cash and other assets** = total assets less loans, securities and goodwill: cash and balances due, fed funds sold and reverse repos, trading assets, other intangibles, premises and other assets.

Table 4: How the funding gap was financed, 2024Q3 to 2026Q2 (percentage points of starting deposits)

Bank	Gap = Loans Δ - Deposits Δ			Financed by (added or subtracted as the header shows)					What the change in equity is made of			
	Loans Δ	Deposits Δ	Funding gap	Equity Δ	- Goodwill Δ	Wholesale funding Δ	- Securities Δ	- Cash and other Δ	Retained earnings Δ	AOCI Δ	Paid-in capital Δ	Noncontrolling interests Δ

Funding gap = Loans Δ - Deposits Δ = Equity Δ - Goodwill Δ + Wholesale funding Δ - Securities Δ - Cash and other Δ (each Δ is the actual change; the header sign says whether it is added or subtracted); the four equity parts add up to Equity Δ (rounding aside). The contributions are shaded blue by size in either direction (darker = larger, one scale across the five columns; the equity parts have their own scale).

Appendix C: calculation reference

Table 6: Calculation reference

Metric	Calculation	Items (MDRM / field)	Source
Firm aggregation	Bank-level dollars summed across each firm's current bank subsidiaries; every ratio recomputed from the sums (never averaged). Year-to-date changes add back banks merged in during 2026 (pro forma).	Parent link RSSDHCR; merger history (change codes 221/223/224)	FDIC BankFind API (institutions, history)
Deposit interest expense (quarterly)	Sum of deposit interest items, converted from year-to-date to quarterly ($Q1 = YTD$; $Qn = YTD(n) - YTD(n-1)$); annualized $\times 365$ / days in quarter.	RIAD4508 (transaction), RIAD0093 (savings incl. MMDA), RIADHK03 (time $\leq$ \$250K), RIADHK04 (time $>$ \$250K), RIAD4172 (foreign offices)	FFIEC Call Report, Schedule RI
Cost of total deposits	Annualized deposit interest expense / average of beginning- and end-of-quarter total deposits.	RCON2200 + RCFN2200	Call Report, Schedule RC
Cost of interest-bearing deposits	Annualized deposit interest expense / average of beginning- and end-of-quarter interest-bearing deposits.	RCON6636 + RCFN6636	Call Report, Schedule RC
Beta (up-cycle and down-cycle)	Change in cost of total deposits / change in quarterly-average effective fed funds rate. Up-cycle: 2021Q4-2024Q3; down-cycle: 2024Q3-2026Q2. Scored separately (higher = more rate-sensitive = more pressure).	Effective fed funds rate (EFFR), daily, calendar-day weighted to quarters	Call Report; NY Fed Markets API
NIB share of deposits	Noninterest-bearing deposits / total deposits, quarter-end.	(RCON6631 + RCFN6631) / (RCON2200 + RCFN2200)	Call Report, Schedule RC
Time deposits (%)	Time deposits (CDs and other fixed-term deposits: under \$100K, \$100-250K, over \$250K; includes retirement and brokered CDs) / domestic deposits, quarter-end.	(RCON6648 + RCONJ473 + RCONJ474) / RCON2200	Call Report, Schedule RC-E
Uninsured (%)	Estimated uninsured deposits / domestic deposits, over banks that report the estimate (small trust banks do not).	RCON5597 / RCON2200	Call Report, Schedule RC-O
Brokered deposits (%)	Brokered deposits / domestic deposits, quarter-end (higher = more reliance on purchased, rate-sensitive funding).	RCON2365 / RCON2200	Call Report, Schedule RC-E
Loans / deposits (%)	Total loans and leases net of unearned income / total deposits, quarter-end.	RCFD2122 / (RCON2200 + RCFN2200); RCON versions if no foreign offices	Call Report, Schedules RC-C, RC
Funding gap and its financing (Table 1a)	(Change in loans less change in deposits) / starting deposits, 2024Q3 to 2026Q2, pro forma. Financed by the change in wholesale funding (liabilities less deposits), the change in equity (assets less liabilities), less the change in securities (HTM at amortized cost plus AFS at fair value), less the change in goodwill, less the change in cash and other assets (assets less loans less securities less goodwill), each over starting deposits; the five add up to the gap.	RCFD2122; RCON2200 + RCFN2200; RCFD2948; RCFD2170; RCFD1754 + RCFD1773; RCFD3163	Call Report, Schedules RC, RC-C, RC-B
Wholesale funding (%)	100 - total deposits / total liabilities.	1 - (RCON2200 + RCFN2200) / RCFD2948 (or RCON2948)	Call Report, Schedule RC
Savings, MMDA + NOW (% of total)	Built from the reported line items: interest-bearing transaction accounts (total transaction accounts less noninterest-bearing), money market, other savings and foreign-office interest-bearing deposits, over total deposits (Table 2). With noninterest-bearing and time deposits it sums to total deposits by accounting identity; R/build_deposit_panel.R checks this for every firm-quarter since 2021Q4 (largest gap 0.00001 percentage points of deposits) and the memo asserts it before Table 2 is drawn.	(RCON2215 - RCON6631) + RCON6810 + RCON0352 + RCFN6636; with (RCON6631 + RCFN6631) and (RCON6648 + RCONJ473 + RCONJ474) = RCON2200 + RCFN2200	Call Report, Schedules RC, RC-E
CDs due within 1 year (% of deposits)	Time deposits with remaining maturity of one year or less (\$250K or less, plus over \$250K) / domestic deposits.	(RCONHK11 + RCONK222) / RCON2200	Call Report, Schedule RC-E
Rate paid on CDs (%)	The average annual interest rate the bank pays on its CDs: annualized interest expense on time deposits divided by average time deposits (RC-K averages), 2026Q2, pro forma.	(RIADHK03 + RIADHK04) / (RCONHK16 + RCONHK17)	Call Report, Schedules RI, RC-K
FHLB advances (% of assets)	Federal Home Loan Bank advances over all maturity and repricing buckets / total assets.	(RCFDF055 + F056 + F057 + F058) / RCFD2170	Call Report, Schedule RC-M
Cash (% of deposits)	Cash and balances due from depository institutions / total deposits.	RCFD0010 / (RCON2200 + RCFN2200)	Call Report, Schedules RC-A, RC

Table 7: Calculation reference (*continued*)

Metric	Calculation	Items (MDRM / field)	Source
Unpledged securities (% of deposits)	(Held-to-maturity amortized cost + available-for-sale fair value - securities pledged at book value) / total deposits. Approximate, because pledged securities are at book value.	(RCFD1754 + RCFD1773 - RCFD0416) / (RCON2200 + RCFN2200)	Call Report, Schedules RC-B, RC
Securities loss (% of CET1)	Fair value below amortized cost on held-to-maturity and available-for-sale securities, pre-tax / common equity tier 1 capital (bank-level, summed to the firm). RCFAP844 shows whether available-for-sale losses are excluded from capital.	[(RCFD1771 - RCFD1754) + (RCFD1773 - RCFD1772)] / RCFAP859	Call Report, Schedules RC-B, RC-R
Coverage of runoff pool (x)	(Cash + unpledged securities) / (uninsured deposits + brokered deposits + CDs of \$250K or less due within a year). A very rough estimate of liquid-asset coverage: it assumes the whole pool leaves and counts all cash and unpledged securities at book value, so it is neither a floor nor a ceiling.	Items above; RCON5597, RCON2365, RCONHK11	Call Report
YTD IB deposit growth (%)	Interest-bearing deposits (total - noninterest-bearing) at 2026Q2 vs 2025Q4, pro forma for 2026 acquisitions.	RCON2200 + RCFN2200 - RCON6631 - RCFN6631	Call Report, Schedule RC
YTD change in deposit cost (bp)	Cost of total deposits, 2026Q2 minus 2025Q4, pro forma.	As above	Call Report
Loan growth (YTD %)	Total loans 2026Q2 vs 2025Q4, pro forma.	RCFD2122 / RCON2122	Call Report, Schedule RC-C
Market share, HHI, GSIB share	Branch deposits by metro area (MSA; non-metro grouped by state), each branch capped at the 99th-percentile size; deposit-weighted across the firm's markets. HHI on each year's top holders. GSIB share = JPM + BAC + WFC + C.	DEPSUMBR, MSABR, RSSDHCRCR, RSSDID	FDIC Summary of Deposits (June 30)
Management tone	Earnings-call commentary coded intensifying / stable / easing with a fixed rubric; Q1 and Q2 2026 calls.	Public call transcripts	Public call transcripts
GSIB placement (Chart 1a)	The four universal GSIBs are placed on the regional scales without re-ranking the fifteen: funding gap computed as for the fifteen (pro forma); pricing score = average of the share of the fifteen with an equal or lower interest-bearing cost and an equal or lower CDs-plus-brokered share. Dashed lines are medians of the fifteen.	Indicators above	Author calculation
Pricing score	Average percentile rank among the fifteen banks (100 = highest) of interest-bearing deposit cost against the peer median and of CDs plus brokered as a share of interest-bearing deposits, 0-100. Table 1a has no score: banks are ordered by the funding gap.	Indicators above	Author calculation

Data checks. Deposit interest summed to the firm matches SEC-reported holding-company deposit interest within 2% in most quarters since 2022. Balance-sheet costs match management-reported figures (e.g. Truist 1.55%, First Citizens 2.07% in 2026) and M&T's and Regions' stated cutting-cycle betas. FDIC branch deposits reconcile to Call Report deposits (exact for 91% of bank-years). The Call Report's daily-average schedule (RC-K), which UBPR uses, is not used for costs: some banks classify zero-rate savings inconsistently between RC-K and the balance sheet, which understated costs for JPMorgan, Bank of America and M&T. Two-point balance averages add a few basis points of noise to single quarters.
